

## Human I1061T NPC1 mice

TECHNOLOGY NUMBER: 2022-414

### INNOVATION

CRISPR/Cas9 gene editing was used to insert human I1061T NPC1 cDNA into exon 2 of the mouse gene, immediately downstream of the mouse signal sequence. Gene targeted mice express human I1061T NPC1, but not mouse NPC1, and are a model of Niemann-Pick type C disease.

### ADDITIONAL DETAILS

\*\*Currently working with Jackson to get these mice deposited.

### Technology ID

2022-414

### Category

Research Tools and Reagents
